

BeAGLE Status

Mark D. Baker

3-December-2020

BeAGLE documentation moved

- Kolja ported the BeAGLE documentation over to github: eic.github.io/software/beagle.html
 - At some point <https://wiki.bnl.gov/eic/index.php/BeAGLE> will change to just point to github instead.
- It is a little more effort to change than the wiki, but I was able to do it with instructions from Kolja.
 - I don't really like the push request model...
- Plan to update & keep up to date. Especially the control cards!

Purpose of this site

This is the main portal to the EIC software, repositories, documentation and resources. It is developed and maintained by the EIC Software Group.

BeAGLE description for the paper

- Control card description
 - In code comments (DPM_INIT), on web & in paper
 - How to handle two levels?
 - commonly changed user parameters (e.g. A , Z , τ_0)
 - vs. expert: non-standard or old kinematic choices, inaccurate DPMJET version of Fermi momentum...
- Approximate application of Fermi momentum for struck nucleon (including $A=2,3$).
- Multinucleon shadowing description.
- Glauber in BeAGLE (including 3D).

3He in BeAGLE / DPMJET

DPMJET Nuclear model is:
3 on-mass-shell nucleons
sitting in a potential.

$M(^3\text{He}) = 2.80839 \text{ GeV}$
 $M(p+p+n) = 2.81611 \text{ GeV}$
8 MeV binding energy

The “remnant” 4-momentum is calculated by momentum conservation.
E.g. for energy, take $E_{\text{eTRF}} + M(^3\text{He})$ and subtract out the Pythia KS==1 particles.
Typically, this leaves $E_{pp} < 2M_p$.

What not to talk about yet.

- PyQM – or perhaps mention in passing?
 - No good solution available for where to put the radiated energy:
 - Throw it away – big energy nonconservation
 - Excite the nucleus – too much – hangs FLUKA, won't match data.
 - Single big gluon – mostly just replacing quark jets with gluon jets – pretty subtle effect.
 - Multigluons – work in progress (abandoned?)
- RAPGAP – not ready for primetime
- GCF??

Technical ToDo

- Fix ^3He kinematics (actually $A=3$).
 - Also fix crash in n-struck ^3He unless it is fixed automatically by the kinematic fix...
- GCF implementation
 - Debug GCF-QE with full INC etc.
 - Currently just works w/ skipping INC.
 - Implement GCF-DIS

EIC R&D progress report coming soon.

- Big question is FY2022 plans for funding my involvement (or not!).
- Probably won't discuss it in the written report, but it will come up during the talk (Late Jan.?).
